The diagram illustrates a distributed file system architecture. It features four nodes (1, 2, 2a, 3) connected to a central bus (16a, 16b). Each node contains an OBJECT-WIRE (4), an OBJECT-TELLER (5), and an OBJECT VAULT (8, 10, 13, 14) or OBJECTSAFE (6, 7, 9). The vaults/safes store a hierarchy of objects: ROOT, MED, OUT BOX, JOB BANK, MAIL BANK, and OBJECTS. A WORK-STATION OR PC (12, 11) is connected to the bus. A FILE SERVER is also connected to the bus.

(57) Abstract

A highly secure, virus resistant, tamper resistant, object oriented, data processing system (1) for depositing, withdrawing and communicating electronic data between one or more individual and/or networked computers (2, 2a, 2b, 3, 3a) comprising one or more computers for processing electronic data including one or more shared electronic storage devices (6, 7, 8, 9, 10) for the temporary and/or permanent storage of said electronic data, each of said computers (2, 2a, 2b, 3, 3a) including custom configurable system programs (100, 200, 300, 400, 500, 600, 700) for asynchronous depositing, withdrawing and communicating said electronic data to commonly shared electronic storage devices, and said programs permitting data archival, accountability, security, encryption and decryption, compression and decompression, and multi-processing capabilities.

FIELD:

BACKGROUND:

One such problem is that to prevent simultaneous access to the same record, i.e., the same physical space on the data storage and retrieval device, software programmers must incorporate file, record, or field locking means into the software which prevent the writing and reading to the same record at the same time. This vastly complicates the writing of the software and functionally slows access time.

Another serious disadvantage of synchronous electronic data management, storage, retrieval and communication systems is that the system may "lock-up" rendering the common data storage and retrieval device inaccessible and unusable until the system is restored to its operable state. Because most network systems are dependent on "sending" information to a computer that is assumed to always be on-line to receive the information, lock-up may occur when: a) computers in the network go off-line or come on-line without proper logging-on or logging-off procedures; or b) an individual computer crashes or its power fails; or c) the operator inadvertently terminates the network communications

1 program to run an applications program. These are just a
2 few of the many ways in which individual computers linked
3 in a network can go off-line, causing the entire network
4 communications to lock-up. And because most network
5 systems cannot easily share information with other
6 networks of differing protocols, users tend to move to
7 bigger and bigger network systems. The bigger the
8 network, the worse the lock-up problem.

9 Another problem is that there is no universal method
10 to store data in a common data storage and retrieval
11 device from the many different applications programs, nor
12 is there any way for multi-tasking applications to share
13 information in an asynchronous manner and at the same or
14 near real time.

15 Another problem is the integrity of the data when
16 passed from computer to computer or from network to
17 network. Most network systems cannot assure complete
18 transmission of data. It is particularly difficult to
19 pass data between different networks, especially if the
20 network systems use differing protocols.

21 Another problem is user tracking. User entry and
22 exit trails are extremely hard to reconstruct after there
23 has been any access, authorized or unauthorized, to the
24 common data storage and retrieval device.

25 Another severe problem of a common data storage and
26 retrieval device is that it is susceptible to user
27 tampering or virus infection, both of which can result in
28 altered, scrambled or deleted data. The susceptibility of
29 user tampering and viral infection often requires
30 elaborate and expensive countermeasures such as password
31 systems and anti-viral software.

32 Another problem is that data cannot be transmitted
33 between networked computers in encrypted form.

34 Another problem is that most network systems require
35 a computer having large computing power and a large
36 capacity data storage device to act as dedicated host or
37 server to run the network operating programs. Then,
38 individual workstations or computer stations ("clients")
39 must be hard-wired to the server. In addition, with many

1 client-server based systems, two different types of
2 computer programs are required, one for server operations
3 and one for client data manipulation. This further
4 complicates the writing of programs and slows access time.

5 Accordingly, there is a need for a computerized
6 system for the management, storage, retrieval and
7 communication of electronic data that is asynchronous in
8 nature and which system overcomes the inherent problems
9 associated with the existing synchronous systems as
10 described above.

11

12

THE INVENTION

TERMS:

14 It is to be understood that any reference to the
15 below listed terms shall have the corresponding meaning
16 provided:

17

18 **Object:** means any binary data file, including but not
19 limited to, documents, programs, graphics, voice mail,
20 faxes, Computer Aided Design (CAD) files, and Binary Large
21 Objects (BLOB's), and the like, as they are traditionally
22 and broadly understood, as well as any other object that
23 is desired to be written to a data storage device, area,
24 or location. In the disclosure herein, reference to data
25 storage device, area, or location or the act of reading or
26 writing may interchangeably refer to "in" or "on". Thus,
27 "writing on" or "writing in" means the same.

28

29 **Temporary Object:** means an object having an expiration
30 date; i.e., in-process objects which are stored
31 temporarily in the electronic data storage means of an
32 ObjectBank System.

33

34 **Permanent Object:** means an object having no expiration
35 date; i.e., an object that will be stored forever on an
36 electronic data storage device compatible with an
37 ObjectBank System.

38

1 **ObjectSafe:** means a specified physical data storage area
2 of a data storage device including, but not limited to,
3 hard disks, floppy disks, magnetic tape, magnetic drum,
4 bubble memory, stringy tape, digital audio tape ("DAT"),
5 VCR tape, laser disks, magneto-optical disks, CD-ROMs, and
6 laser cards.

7
8 **ObjectVault:** means a dedicated computer having an
9 ObjectSafe which has sufficient data storage capacity to
10 store all objects of all ObjectSafes on the ObjectWire
11 Network.

12
13 **ObjectTeller:** means an OLE-aware and OLE-accessible
14 computer program having user customizable function means
15 to deposit and withdraw ("retrieve") objects to and from
16 ObjectSafes and to conduct status checks of deposits and
17 withdrawals.

18
19 **ObjectWire:** means a computer program having user
20 customizable function means for communications, i.e.,
21 polling and retrieving objects, from other individual or
22 networked computers each having an ObjectWire program.

23
24 **ObjectWire Network:** means the architecture of all
25 computers compatible with an ObjectBank System, i.e., any
26 one or more computers linked together by having an
27 ObjectTeller and ObjectWire program installed.

28
29 **ObjectBank System:** means any one or more computers having
30 installed an ObjectTeller and ObjectWire program and a
31 system architecture configuration comprising an ObjectSafe
32 and/or ObjectVault, MED and Out Box. A computer having an
33 ObjectBank System may be referred to as an ObjectBank
34 System computer.

35
36 **Message Exchange Database ("MED"):** means a defined
37 physical electronic data storage area of an ObjectSafe or
38 ObjectVault accessible via the ObjectTeller program or
39 other OLE-aware application program for the purpose of

1 depositing and withdrawing temporarily stored objects for
2 the purposes of communicating messages requesting an
3 object be stored in a target ObjectSafe or ObjectVault or
4 requesting an object be retrieved from a target ObjectSafe
5 or ObjectVault.

6

7 **ObjectBank Manager:** means a specified user responsible
8 for the operation, care and maintenance of a computer or
9 computer network having an ObjectBank System.

10

11 **Out Box:** means a temporary electronic data storage area
12 of an ObjectSafe for the posting of objects via the
13 ObjectTeller program to be retrieved and stored to one or
14 more other computer's ObjectSafes or ObjectVault on the
15 ObjectBank Network.

16

17 **Index Card ("IC"):** means a permanently stored customizable
18 and modifiable electronic index data file of every object
19 of the ObjectBank System having the following data fields:
20 object type, date/time, IC identification code, parent IC
21 identification code, created by, key words (four),
22 abstract, object source path; and, each index data file
23 having user selected features for data encryption, data
24 compression, password access, public or private list
25 access, and IC visibility.

26

27 **Index Card Template:** means an electronic template or
28 "mask" having a default configuration of an uncompleted or
29 "blank" Index Card and which template is user customizable
30 and which default or customized template is used for the
31 creation of an object Index Card.

32

33 **OLE:** means "object linking and embedding" as is commonly
34 known in the field of the art.

35

22 process routine of the ObjectWire program of the System
23 invention.

24

25 **SUMMARY:**

26 The invention is directed to an asynchronous
27 electronic data management, storage, retrieval and
28 communication system and method compatible with any multi-
29 tasking operating system. The overall system is called an
30 "ObjectBank System." The ObjectBank System comprises a
31 user interface program called the "ObjectTeller" program,
32 a communications program called the "ObjectWire" program,
33 (both programs written in "C" language and capable of
34 being written by one skilled in the art of computer
35 programming), and computer system architecture including
36 a standard industry computer processor, input/output
37 devices and at least one primary defined physical data
38 storage area for "objects" called the "ObjectSafe" or
39 "ObjectVault." Objects can be any type of binary data

1 file. Each object is index referenced by use of
2 electronic "index cards" and stored in an ObjectSafe for
3 retrieval upon request using the ObjectTeller Program and
4 communication among computers by the ObjectWire Program.
5 All Permanent Objects of all ObjectBank System computers
6 on the ObjectWire Network may be stored in an archival
7 ObjectSafe which is then called an ObjectVault. There is
8 no physical difference between an ObjectSafe and an
9 ObjectVault other than an ObjectSafe permanently stores
10 select objects whereas an ObjectVault permanently stores
11 all objects from all ObjectSafes on an ObjectWire Network.
12

13 Objective of the System Invention:

14 The objective of the ObjectBank System is to provide
15 a method means for electronic data management, storage,
16 retrieval and communication of data stored in a
17 universally compatible ASCII format in at least one
18 central storage device (ObjectSafe or ObjectVault) and
19 shared in an asynchronous manner on a peer to peer basis
20 with other ObjectBank System computers. Each object in
21 the ObjectBank System is indexed and stored to a user
22 selected target ObjectSafe and/or ObjectVault. Once
23 stored, objects are never modified, overwritten or
24 deleted, but are only copied and the copies shared with
25 other users. Objects are shared between users by message
26 request using a Message Exchange Database ("MED"). Upon
27 the message request by other users for the sharing of a
28 particular object (or all objects) from a specified (or
29 all computers) on the ObjectBank Network, the ObjectBank
30 Manager of the target ObjectSafe copies the requested
31 object(s) and places the object(s) in an "Out Box" for
32 "pick-up" (transmission) via the ObjectWire program by the
33 requesting users. Since objects are only copied from the
34 ObjectSafe or ObjectVault, the stored objects are guarded
35 against any modification or tampering and the ObjectSafe
36 and/or ObjectVault is protected against virus infection
37 because no object stored is ever "run" which execution
38 would typically provide the mechanism for infection by or
39 replication of a virus. The ObjectBank System may also

1 provide data protection by periodically reminding the
2 ObjectBank Managers to permanently store their important
3 Temporary Objects and delete multiple copies of Temporary
4 Objects. The ObjectBank System is specially designed to
5 pass information between computers on the ObjectWire
6 Network with near 100% accuracy. An Index Card for each
7 object maintains at least one sequential, historical trail
8 of its origin. Thus, each object's Index Card will have
9 a reference record of its origin and of the "family tree"
10 of related objects, i.e., the physical addresses of each
11 parent and child of an object. Thus, Index Cards help
12 speed access to objects, record a trail of copies of
13 objects that are deposited or retrieved, record who made
14 the deposits or requests, and record what other ObjectBank
15 System computers have copies of objects and Index Cards.
16 Like any other Permanent Object, completed Index Cards are
17 stored in the ObjectSafe or ObjectVault and copies may be
18 made and transferred to other users on the ObjectWire
19 Network.

20

21 Interconnectivity of the System Invention:

22 The ObjectBank System of this invention is
23 particularly adapted for use with computers which may be
24 linked via modem or network using currently available
25 network programs, such as Lantastic and Novell. To be
26 compatible with the ObjectBank System, however, each stand
27 alone computer or each networked computer system requires
28 its own ObjectTeller and ObjectWire programs. Together,
29 the ObjectBank System computers comprise an ObjectWire
30 Network. Communications between computers on the
31 ObjectWire Network is on a "receive alone" basis, i.e.,
32 there is no "sending" of any data or object to a target
33 address. The ObjectWire program is configured by a user
34 to look for and request certain types of objects by
35 designated search criteria. The ObjectWire program time
36 sequentially "polls" via modem or network a Message
37 Exchange Database ("MED") of other ObjectNetwork computers
38 for the designated type of object fitting the search
39 criteria. If the designated type of object is made

1 available for copying by a ObjectBank Manager, i.e.,
2 placed in an Out Box, it is transmitted to the requesting
3 user by the requesting user's ObjectWire program. Because
4 each computer of the ObjectBank System only receives only
5 copies of objects made available by other users on the
6 ObjectWire Network, there is no "sending" of data and
7 therefore no mechanism to cause the ObjectBank System to
8 lock-up. Thus, computers which remain on the ObjectWire
9 Network can continuously receive available (stored)
10 objects and in any order from any computer system which
11 remains on the ObjectWire Network. If any computer goes
12 off the network through a power outage, computer hardware
13 or software defect, user error, the ObjectBank System of
14 operation is not affected. Each ObjectBank System
15 compatible computer will continue to poll for requested
16 objects and hold any object retrieval or storage requests
17 until the target computers are reconnected.

18 Computers in the ObjectWire Network can be
19 interconnected via modem, Local Area Network (LAN) which
20 involves linkage of in-house computers, or Wide Area
21 Network (WAN) which involves networks linked to other
22 networks. The ObjectWire program has the capability to
23 log on sequentially to successive networks using different
24 network software and protocols, and to process the
25 respective storage and retrieval message requests.
26 Because objects are "picked up" by the ObjectBank System
27 rather than "sent," the system of this invention is
28 particularly conducive to an architecture wherein the
29 ObjectBank System connects to multiple networks
30 sequentially and picks up from each Message Exchange
31 Database (MED) any storage or retrieval message requests
32 to perform on that network or pass along to an ObjectSafe
33 on another network before disconnecting and connecting to
34 the next network. This allows users to share objects
35 easily in an asynchronous manner among several non-
36 compatible network systems.

1 Rules of the System and Method Invention:

2 Two basic rules of the ObjectBank System and method
3 apply: First, no computer may write to any storage device
4 of any other computer on the ObjectWire Network. Second,
5 permanently stored objects are never modified, over-
6 written or deleted. Therefore, only copies of stored
7 objects are ever transmitted to other computers on the
8 ObjectWire Network.

9

10 Encryption and Compression of Objects:

11 For data security and efficiency of operation, object
12 encryption and compression may be employed. In the best
13 mode of operation, the default configuration of the
14 ObjectTeller program is to encrypt and compress all
15 objects for permanent storage as well as transmission to
16 other users via the ObjectWire program. However, the
17 ObjectBank Manager has the option of specifying that a
18 particular object or all objects not be encrypted or
19 compressed.

20

21 Access Authorization:

22 In addition to object encryption and compression, the
23 ObjectBank System maintains a multi-leveled access
24 authorization structure for users, messages, index cards,
25 and objects. When the user accesses the ObjectBank
26 System, the user's identification code and password is
27 verified by the ObjectTeller Program to determine whether
28 that user is authorized to access the object stored in
29 that ObjectSafe. The ObjectTeller configuration files
30 include the list of authorized users to store and/or
31 retrieve all or particular objects. Modifications to the
32 list are appropriately protected so that only authorized
33 persons (e.g., the ObjectBank Manager) can add or delete
34 user names. There are three levels of access to objects:

35 (1) if the object is available for anyone on the
36 ObjectWire Network to copy, then the access is
37 "Public";

- 1 (2) if there is a distribution list of authorized
2 users to particular objects, then the access is
3 "Restricted"; and
4 (3) if there is only the original user on the
5 authorization list, then the access is "Private."

6

7 Index Cards:

8 All ObjectBank System transactions are recorded on an
9 object reference Index Card which is created automatically
10 when an object is stored to an ObjectSafe or ObjectVault.
11 Index Cards provide a rapid reference classification means
12 for retrieval of objects from an ObjectSafe or
13 ObjectVault. Index Cards also provide a means for
14 determining the genealogy of object requests, storage, and
15 retrievals. In addition, Index Cards provide the means by
16 which the user determines: (1) whether or not the object
17 is to be encrypted and/or compressed; (2) the password;
18 (3) the access level (i.e., public, restricted, or
19 private); (4) the access list of authorized users; (5)
20 whether or not the Index Card will be "visible" (i.e.,
21 displayed) to other users; (6) up to four "key words" of
22 the object to be used as index search terms; and (7) an
23 abstract (summary) of the subject content of the object.

24

25 Each ObjectBank System keeps its own set of Index
26 Cards and records, in date/time sequence, of all requests
27 for objects, all retrievals obtained or denied, all
28 deposits offered and/or accepted by the ObjectSafe. The
29 ObjectBank System maintains indexes to help speed access
30 to its objects, to record a trail of copies of objects
31 that are deposited or retrieved, to record who made the
32 deposits or requests, and to record what other computers
33 have copies of objects and indexes. In addition, users
34 may create via an Index Card Template additional reference
35 Index Cards of the object, such as: WordPerfect documents
36 by "Author" and "Subject"; Lotus files by the contents of
37 cell "A1"; Dbase files by "Field" within "Record"; CAD
38 files by "Changed-By," etc. A user may build Temporary
39 Index Cards of his and other user's objects for a specific

1 search. By way of example, a "fuzzy" search may be
2 conducted by searching for certain key words on Index
3 Cards. In addition, searches may be made directly of the
4 objects in the ObjectSafes, if the Index Card information
5 is not complete or sufficient.

6 Index Cards of the users objects are stored in the
7 users ObjectSafe. Index Cards of objects stored on other
8 ObjectSafes may be also be stored if selected by the user.
9 Typically, the user's computer ObjectSafe has more limited
10 storage space and the user will not want to store all
11 Index Cards from all the ObjectSafes. The user can
12 configure his ObjectBank System to keep only selected
13 Index Cards related to specific topics. However, if the
14 user wishes to see other types of Index Cards, he can
15 configure the ObjectWire program to request and retrieve
16 Index Cards relating to a particular subject from other
17 ObjectSafes.

18 Like all objects, all Index Cards for all ObjectSafes
19 on the ObjectWire Network may be stored in the
20 ObjectVault. Index Cards are never deleted. If they are
21 updated, the prior Index Cards are always available for
22 review. Periodically, Temporary Index Cards are stored as
23 Permanent Objects in an ObjectVault for safekeeping.

24

25 Configuration of the ObjectBank System:

26 An ObjectBank System is configured via both the
27 ObjectTeller program and the ObjectWire program. The
28 ObjectTeller program contains configuration routines used
29 to install and configure the ObjectBank System on each
30 computer and to create an ObjectSafe or ObjectVault. The
31 configuration process includes the steps of:

- 32 1. Assigning a unique ObjectSafe Identification Code
33 to the computer for use on the ObjectWire Network;
- 34 2. Designating storage rights, i.e. identifying
35 whether this ObjectSafe will permit storage of either
36 Permanent or Temporary Objects, both, or neither (in which
37 case users could only access information stored in other
38 ObjectSafes over the ObjectWire Network);

- 1 3. Setting which physical storage device(s) can be
- 2 used as the ObjectSafe;
- 3 4. Setting the maximum size for the ObjectSafe;
- 4 5. Determining whether other users will be allowed
- 5 to store objects in the ObjectSafe;
- 6 6. Assigning to the User List user identification
- 7 codes, access levels and passwords which permit users to:
- 8 a. retrieve from the ObjectSafe;
- 9 b. retrieve from other selected ObjectSafes;
- 10 c. store to the ObjectSafe;
- 11 d. store to other selected ObjectSafes;
- 12 e. perform "housekeeping functions" --including
- 13 assigning at least one user as the "ObjectBank Manager"
- 14 who will be capable of transferring Permanent Objects from
- 15 the ObjectSafe, change access levels and user passwords,
- 16 etc.;
- 17 7. Specifying the software and hardware
- 18 configuration of the computer to provide other ObjectBank
- 19 System users an indication of whether or not their
- 20 computers can use a certain object;
- 21 8. Setting up the default Index Cards that will be
- 22 used for the various types of objects that will be stored
- 23 in the ObjectSafe and permit the user to build new default
- 24 Index Cards; and
- 25 9. If this is the first time the ObjectBank System
- 26 is used on the computer, the creation of hidden
- 27 subdirectories and the verification of connections to the
- 28 ObjectWire Network.
- 29 The ObjectWire program also contains configuration
- 30 routines which include the process of:
- 31 1. Determining which Index Cards from other
- 32 ObjectSafes will be stored in its ObjectSafe; and
- 33 2. Specifying which other ObjectSafes shall and
- 34 shall not be polled on the ObjectWire Network and the
- 35 access method (e.g., network card, modem phone number,
- 36 password, etc.).

1 Housekeeping Functions:

2 There are a number of Housekeeping functions of the
3 ObjectTeller program of the Objectbank System. These
4 functions include the following:

5 1. Backup/Restore Objects. This function is used to
6 backup the objects stored on the ObjectSafe to another
7 storage device or to restore the objects stored on the
8 ObjectSafe from another storage device.

9 2. Rebuilding Index Cards. This function is used to
10 rebuild Index Cards from the original object stored in the
11 ObjectSafe if the Index Cards have been corrupted.
12 Certain Index Card information is written directly on the
13 object as a header label when the object is compressed for
14 storage in the ObjectSafe. This header information is
15 sufficient to rebuild most of the Index Card if it is
16 destroyed. This function is also used to build temporary
17 indexes for a fuzzy search by a user; for example,
18 searching all Index Cards or all objects for the phrase
19 "cartridge valve" occurring within a search boundary of 10
20 words from the phrase "competitor". This function is also
21 used to set up the default Index Cards that will be used
22 by this ObjectSafe for various types of objects.

23 3. Move Objects to Other Physical Storage Devices.
24 This function is used to move objects from one ObjectSafe
25 to another or ObjectVault, to move objects from one
26 physical storage location to another within an ObjectSafe,
27 to move objects from Temporary to Permanent storage, or to
28 move objects to a "NULL" device. Upon the execution of a
29 move operation, the object will no longer reside in the
30 original source ObjectSafe location, although the Index
31 Card will remain indicating that the object was in that
32 ObjectSafe location and moved to another ObjectSafe
33 location. Permanent Index Cards are never deleted and
34 therefore there will always remain a record of the prior
35 and subsequent locations of moved objects.

36 4. Deleting Objects.

37 a. At any time a user may delete Temporary
38 Objects from the ObjectSafe and suggest that Temporary
39 Objects be deleted from other users ObjectSafes.

1 Permanent Objects are never completely "deleted," but are
2 moved to another storage device to free up storage space.
3 The only method to actually, physically "delete" a
4 Permanent Object from the ObjectSafe or ObjectVault is to
5 purposefully move the object to a "NULL" device.

6 b. The ObjectBank Manager may delete any user's
7 Temporary Objects from the ObjectSafe and move any
8 Permanent Objects to a NULL Device. There may be a
9 different ObjectBank Manager for each ObjectSafe. If one
10 or more ObjectVaults have been created, each ObjectVault
11 must have at least one ObjectBank Manager who has physical
12 access to the ObjectVault computer. An ObjectBank Manager
13 or user may only perform these "delete" functions from the
14 local keyboard attached to the ObjectSafe or ObjectVault
15 computer when logged off the ObjectWire Network.

16 c. Anytime that objects are deleted from an
17 ObjectSafe, the Index Cards are updated with the
18 information about the deletion. Even if Permanent Objects
19 are "deleted" by moving the object to a NULL Device, Index
20 Cards remain in the ObjectSafe as a permanent record of
21 the object's prior existence.

22 5. Packing Objects After Deletions. When the object
23 is moved from the ObjectSafe, the ObjectBank System will
24 pack the remaining objects to optimize physical storage
25 space usage.

26 6. ObjectBank System Start-up/Shut-down. The
27 ObjectBank System programs contain a Start-up/Shut-down
28 routine for entering and exiting the ObjectBank System
29 (i.e., ObjectTeller and ObjectWire programs). The user
30 may use this function to start-up or shut down the
31 ObjectBank System completely, or just turn on or off
32 selected functions of the ObjectBank System. Upon the
33 execution of the routine, the ObjectWire Program will poll
34 the Message Exchange Databases of other ObjectSafes on the
35 ObjectWire Network to determine if there are any message
36 requests or works-in-process.

1 Operation of the ObjectBank System Method:

2 In typical operation, the ObjectBank System method of
3 this invention functions as follows:

4
5 **Depositing of Objects:** When a user determines that an
6 object is to be deposited ("stored") in a selected target
7 ObjectSafe or ObjectVault, a user completes an Index Card
8 identifying the object to be deposited. The Index Card is
9 generated and completed by either executing the
10 ObjectTeller program functions directly or indirectly
11 through an OLE aware application program (which
12 automatically executes the ObjectTeller program functions
13 upon the execution of a certain application command such
14 as "Save," for example). Once the Index Card is
15 completed, the object is encrypted, compressed, and copied
16 into the user's ObjectSafe. If the object is to be
17 deposited to another users ObjectSafe or to an
18 ObjectVault, the encrypted and compressed object is copied
19 to the user's Out Box and a message request that the
20 object be deposited in the target ObjectSafe or
21 ObjectVault is placed in the user's Message Exchange
22 Database. The object is left in the user's Out Box for
23 pick-up ("copying") at some near future time by the target
24 ObjectWire Program of the target ObjectBank System.

25 Each ObjectWire program of each ObjectBank System
26 polls each Message Exchange Databases of the various
27 computers on the ObjectWire Network. This polling may be
28 on a regular, timed interval basis, or it may be done on
29 a learned, frequency-of-use-basis. When an ObjectWire
30 program detects a message request to deposit an object to
31 its System's ObjectSafe or ObjectVault, it verifies that
32 the user is authorized to store objects in its ObjectSafe
33 or ObjectVault, then copies to its ObjectSafe or
34 ObjectVault the object left for pick-up in the source
35 user's Out Box. At that time, a running historic record
36 is updated and put on an Index Card and placed in the
37 target ObjectBank System's Out Box for pick up by the
38 source of the message request and all other ObjectBank

1 Systems. In this manner, all ObjectBank Systems are aware
2 of all completed ObjectBank transactions.

3
4 **Withdrawal of Objects:** When an ObjectBank System user
5 wants to withdraw ("retrieve") a particular object from an
6 ObjectSafe or ObjectVault, the user executes the
7 ObjectTeller Program withdrawal routine which produces an
8 Index Search Card to be completed for the purpose of
9 searching for and finding the desired object's Index Card.
10 If Index Cards are to be searched on other ObjectBank
11 System computer's, a retrieval request message directed to
12 the target ObjectBank System is place in the Message
13 Exchange Database for pick-up by the target System(s).
14 The target ObjectBank System's ObjectWire program polls
15 each Message Exchange Database, detects the request
16 message, searches for the object Index Card requested,
17 determines that the requesting user is authorized to
18 retrieve the object, locates the object, makes a copy,
19 places it in its Out Box for pick-up and places a message
20 in its Message Exchange Database that it is ready for
21 pick-up. The requesting user's own ObjectWire Program
22 cyclically polls the target ObjectBank Systems Message
23 Exchange Database. When the ObjectWire program detects
24 that the object requested is in the target ObjectBank
25 Systems Out Box for pick-up, it copies the object,
26 decrypts and decompresses the object, and writes it to the
27 designated ObjectSafe (either a file or in an OLE aware
28 application file) where the user may then access and
29 manipulate the object in whatever manner desired. Once
30 the object has been successfully withdrawn ("picked-
31 up\copied\retrieved") by the user, the Index Card of the
32 object is updated and a successful retrieval message is
33 placed in the Message Exchange Database. When the target
34 ObjectWire Program sees the acknowledgement of the
35 retrieval and that request message no longer exists, it
36 updates the Index Card with the successful retrieval
37 information. If the request message is not removed, the
38 object stays in the target ObjectBank System's Out Box for

1 a fixed period of time or until deleted by the ObjectBank
2 Manager.

3 Note that during this process no computer has written
4 to another computer's disk and there has been no tampering
5 with the object that was originally stored because the
6 user does not have access to the stored object. The user
7 only works with copies of objects, and cannot access the
8 ObjectSafe directly. The object is left in the ObjectBank
9 Out Box until the user's ObjectWire Program picks up the
10 copy. If the user's computer inadvertently goes off line
11 through a power failure or computer crash, the transfer
12 will not be affected. When the user's computer comes back
13 on line, the user's ObjectWire Program can access the
14 ObjectBank Out Box and pick up the object.

15

16 **DETAILED DESCRIPTION OF THE BEST MODE:**

17 Fig. 1 shows a schematic of a plurality of computers
18 2, 2a, 2b, 3 and 3a each having an ObjectBank System of
19 this invention and arranged in an exemplary ObjectWire
20 Network 1 configuration. The ObjectWire Network 1 shows
21 by way of example the capability of any computer having an
22 ObjectBank System, whether a stand alone personal computer
23 2, 2a, 2b or networked computer 3, 3a, to share objects on
24 an asynchronous, peer to peer basis with any other stand
25 alone or networked computer on the ObjectWire Network 1
26 having an ObjectBank System. There is no limit 16a,b to
27 the number of ObjectBank System computers which may
28 connect to each other via modem, LAN, WAN or other
29 connecting means and thereby comprise the ObjectWire
30 Network 1.

31 Each ObjectBank System computer 2, 2a, 2b, and
32 networked computers 3 and 3a of Fig. 1, comprises a
33 standard industry computer having in addition to its
34 operating system, peripheral input/output devices and
35 applications programs, the "ObjectTeller" program 4 and
36 the "ObjectWire" program 5, and an object storage device
37 (6, 7, 8, 9 and 10), called an "ObjectSafe" (6, 7, 9 and
38 10) or "ObjectVault" (8). While under certain
39 circumstances it is preferred that each ObjectBank System

1 computer have its own ObjectSafe, depending on the
2 intended use of the computer(s) or networked computer(s)
3 on the ObjectWire Network, it is not required that each of
4 the computers have its own object storage device because
5 ObjectBank System computers can share an ObjectSafe with
6 that of another ObjectBank System computer. For example,
7 computer 2a need not have its own ObjectSafe 7 because it
8 could use computer 2's, 3's or 3a's ObjectSafe. Likewise,
9 in existing network configurations 3 and 3a, individual
10 work stations 11 and 12 do not require their own
11 ObjectSafes, if file servers 13 and 14 include an
12 ObjectSafe 9 and 10 or an ObjectSafe outside the network
13 is used. Thus, if desired, all computers on the
14 ObjectWire Network could be configured like an existing
15 client-server configuration whereby all computers would
16 share one computer's ObjectSafe. Computer 2b is
17 configured such that it has an ObjectVault 8 rather than
18 an ObjectSafe. An ObjectVault is an ObjectSafe which has
19 been configured to store a copy of all objects on the
20 ObjectWire Network whereas an ObjectSafe is configured by
21 a user to store only select objects on the ObjectWire
22 Network. Therefore, any reference herein to an ObjectSafe
23 may interchangeably be referred also to as an ObjectVault
24 depending on the desired user configuration. It is
25 preferred that at least one computer on the ObjectWire
26 Network include an ObjectVault and that this computer be
27 physically secure 15 from access by all persons except a
28 designated ObjectBank Manager responsible for the
29 operation and maintenance of the ObjectVault computer.

30 Each ObjectSafe (6, 7, 9 and 10) and ObjectVault (8)
31 is custom configurable. A typically envisioned
32 configuration for each ObjectBank System's ObjectSafe disk
33 directory would include the following subdirectories:
34 Root Directory, DOS, Windows, Network Programs, Other
35 Application Programs (may be accessible on the ObjectWire
36 Network), ObjectBank Programs, ObjectSafe Configuration,
37 ObjectTeller - User Interface, ObjectWire - Network
38 Interface, ObjectBank Work Area, ObjectBank Message
39 Exchange Database, ObjectBank Out Box (read-only on the

1 network), ObjectSafe Indexes (certain selected indexes),
2 and ObjectSafe Objects with the following two optional
3 subdirectories: Temporary Object File, Permanent Object
4 File. A typically envisioned ObjectBank System
5 ObjectVault computer disk directory would include the
6 following subdirectories: Root Directory, DOS, Windows,
7 Network Programs, ObjectBank Programs, ObjectVault
8 Configuration, ObjectWire - Network Interface, ObjectBank
9 Work Area, ObjectBank Message Exchange Database,
10 ObjectBank Out Box (read-only on the ObjectWire Network),
11 ObjectVault Indexes (all objects, all object indexes), and
12 ObjectVault Objects having the following two
13 subdirectories: Temporary Object File and Permanent
14 Object File.

15 Each ObjectBank System computer manages objects by
16 indexing, depositing ("storing"), withdrawing
17 ("retrieving") and communicating objects through the
18 functions of the ObjectTeller and ObjectWire programs 4
19 and 5. The ObjectTeller and Object Wire programs are
20 written in "C" language and are capable of being
21 constructed by one skilled in the art of computer
22 programming using standard industry routines. The
23 ObjectTeller program 5 is a menu driven user interface
24 program for the configuration and use of the ObjectBank
25 System, i.e., the depositing and withdrawing of objects,
26 and for determining the status of the deposits and
27 withdrawals of objects. The ObjectWire program 4 is a
28 communications program having its own configuration and
29 function files for the posting and withdrawal of objects
30 to and from the other ObjectBank System computers on the
31 ObjectWire Network 1. The functions of the ObjectTeller
32 and ObjectWire programs can be accessed directly by
33 executing each program independently of any other program.
34 However, the functions of the ObjectTeller and ObjectWire
35 programs are preferably accessed and executed indirectly
36 through an OLE aware program operating within a MicroSoft
37 Windows operating environment. This preferred usage
38 precludes the user from having to exit an applications

1 program to directly access and execute the functions of
2 the ObjectTeller and ObjectWire programs.

3

4 **THE OBJECTTELLER PROGRAM:**

5 The ObjectTeller program 5 comprises functions to
6 permit a user means for processing the deposit and
7 withdrawal of objects to and from one or more ObjectSafes
8 (6, 7, 9 and 10) and/or ObjectVaults (8) on the ObjectWire
9 Network 1, and review the status of deposits and
10 withdrawals.

11 Fig. 2 is a flowchart diagram of the configuration
12 routine of the ObjectTeller program 5 of Fig. 1. Upon
13 initial execution 101 and any subsequent execution of the
14 ObjectTeller program, the ObjectTeller Configuration
15 initialization file (ObjectTeller.ini) is read and saved
16 in a temporary object, a local MED and ObjectSafe is
17 opened, an array for each available ObjectVault and
18 ObjectBank is built, and arrays for the User Data and
19 Index Card Templates are built. If an error occurs, then
20 the user is returned to the system.

21 Then, a user or ObjectBank Manager has the option to
22 custom configure the ObjectBank System by selecting and
23 executing various options from a menu. The configuration
24 routine permits the user (or ObjectManager) to: (1) select
25 and change 102 the ObjectSafe(s) and/or ObjectVaults to
26 which objects are to be deposited to or withdrawn from
27 (the "target" ObjectSafe or ObjectVault); (2) select and
28 change 107 which users are authorized to deposit or
29 withdraw objects from an ObjectSafe and what level of
30 access each user is permitted; and, (3) select and change
31 110 which Index Card Template is to be used to record
32 object information.

33 1. Change ObjectSafe/ObjectVault:

34 Referring further to Fig. 2, if a user (or
35 ObjectManager) desires to select or change a target
36 ObjectSafe (or ObjectVault), he executes from a menu the
37 ChangeObjectSafe function 102. This causes invocation of
38 the file "SAFE.dlg" file which includes the ObjectSafe and
39 ObjectVault configuration information. Then, the

1 ObjectBanks and ObjectVaults known to this ObjectTeller
2 are listed and the current target ObjectSafe and
3 ObjectVault are indicated. The user then selects 103 from
4 the list of logical devices which ObjectSafe and
5 ObjectVault is to be the current ObjectSafe and
6 ObjectVault. The selection identifies the path to the
7 desired target ObjectSafe or ObjectVault. Once the
8 current target ObjectSafe and ObjectVaults are selected
9 103, the user can then select 104 to change the size and
10 type of storage (i.e., ObjectSafe or ObjectVault), if
11 desired.

12 To make a change, the user first selects the
13 ObjectSafe or ObjectVault from the SAFE.ini file and then
14 selects to remove the ObjectSafe or ObjectVault from the
15 SAFE.ini file or to change its parameters. If removal is
16 desired, the selected ObjectSafe or ObjectVault is removed
17 from the SAFE.ini file. If a change is to be made, an
18 ObjectSafe/ObjectVault maintenance form is presented and
19 the existing safe/vault parameters are listed. The use
20 then modifies the parameters. The parameters peculiar to
21 the selected logical device are verified. If verified,
22 then the user accepts or rejects the changes. If a change
23 to the size and storage type is not desired, the user can
24 then select 105 which other ObjectBanks systems are to be
25 notified of object deposit and withdrawal activity. This
26 is accomplished by selecting the target ObjectSafes and/or
27 ObjectVaults from the SAFE.dlg file. The new targets are
28 evaluated and the pathways validated. If validated
29 successfully, a list of the available storage and types of
30 storage registered for the ObjectSafe are listed.

31 After the user completes any changes of ObjectSafes
32 or ObjectVaults 102, selects the logical device for safe
33 work 103, changes size or storage types 104, and/or
34 selects the notification options 105, the ObjectBank
35 System's configuration file database ("OBJBANK.INI"), is
36 updated 106 to record the changes.

1 2. Change User Data:

2 Referring further to Fig. 2, if a user desires to add
3 new and/or change authorized users of the ObjectBank
4 System, the user selects from a menu the ChangeUserData
5 function 107, the AddNewUsers function 108 and/or selects
6 the ChangeExistingUser function 109.

7 If the user selects AddNewUsers 108, a maintenance
8 template (form) is presented for completion by the user.
9 The user must input certain minimum information such as
10 the new users name, user type (i.e., depositor or
11 borrower), user description (i.e., a general comment), the
12 unique user identification ("ID"), and the user's main
13 storage "bank" (i.e., ObjectSafe). Additional optional
14 information may be input, such as, type of "bank account",
15 any co-users, correspondent banks for this user, the user
16 generation, short name, government identification number,
17 visibility indicator, primary operating "branch" (i.e.,
18 home directory/pathway), date account opened, and
19 permissible activities. The completed maintenance
20 template is then verified and either accepted or rejected
21 by the user and upon either of which the user moves on to
22 ChangeExistingUsers function 109.

23 If the user desires to change an existing user,
24 he/she selects ChangeExistingUsers 109, which causes a
25 list of existing current ObjectBank users to be displayed.
26 The user selects from the list the user to be changed and
27 that selected user's current information is displayed in
28 a maintenance template form. The user completes the
29 changes and either verifies or rejects the changed
30 information.

31 Once the user adds any new users 108 or makes any
32 change to the existing users 109 and the changes are
33 verified, accepted or rejected, the ObjectBank System's
34 configuration database file OBJBANK.INI is updated 106 to
35 record the additions or changes.

36 3. Change Index Card Template:

37 If a user desires to add new or change the Index Card
38 Templates to which object index information will be
39 recorded, the user selects from a menu the

1 ChangeIndexCardTemplates function 110, then AddTemplates
2 111 or ChangeTemplates 112 functions.

3 If AddTemplates 111 is selected, a template
4 maintenance form is presented and the user inputs certain
5 minimum information such as the template name and class,
6 the data type, the application type, and general usage
7 description. Additional optional information may also be
8 input such as the short name of the template, referenced
9 bank accounts and the review date of the template. The
10 added template is then verified and either accepted or
11 rejected. If accepted, the new template is retained for
12 subsequent updating of the OBJBANK.INI configuration file.
13 Once the new template is either accepted or rejected, the
14 system goes to the ChangeTemplates function 112.

15 If the user does not desire to change a template, the
16 OBJBANK.INI configuration file is updated. If the user
17 desires to change a template, the ChangeTemplates function
18 112 causes a list of the current bank templates to be
19 presented. The user then selects which template is to be
20 changed and the template with current information is
21 displayed in standard template maintenance form. The user
22 changes the desired information (i.e., completes the
23 form). The information is then verified and either
24 accepted or rejected. If accepted, a new template with
25 the changed information is retained for updating the
26 OBJBANK.INI configuration file. If accepted or rejected,
27 the OBJBANK.INI file is then updated 106. Once the
28 OBJBANK.INI file has been updated 106 and no further
29 ObjectTeller configuration changes or additions 102, 107,
30 or 110 are desired, the ObjectTeller configuration routine
31 is terminated by selecting 113 an exit function
32 (StopObjectTellerConfiguration). The user is then
33 returned to the operating system environment from which he
34 began prior to execution of the configuration routine.

35 Fig. 3 is a flowchart diagram for the ObjectTeller
36 program deposit routine 200. To deposit an object in a
37 target ObjectSafe, the user selects and executes 201 from
38 a menu the ObjectTeller Deposit routine. Upon selection,
39 the ObjectTeller.ini file is read and saved in a temporary

1 object. The local Message Exchange Database (MED) and
2 local ObjectSage are opened and arrays for the available
3 ObjectVaults, ObjectBanks, user data, and index card
4 templates are built. In addition, the OTdep.dlg
5 (ObjectTeller deposit menu) file is invoked.

6 1. Select a Target ObjectSafe 202. Upon selection
7 201 of the deposit function, the SAFE.dlg (ObjectSafe and
8 ObjectVault configuration) file is also invoked and the
9 ObjectSafes and ObjectVaults known to this ObjectTeller
10 are listed and the current target ObjectSafe and
11 ObjectVault are indicated. The user then selects 202 the
12 target ObjectSafe from his\her own ObjectSafe (if computer
13 resident) and/or one or more other ObjectSafes on the
14 ObjectWire Network 1 to which he\she has been authorized
15 access. The user can select multiple target ObjectSafes
16 if objects are desired to be deposited in several
17 ObjectSafes.

18 2. Identify the object(s) to be deposited 203. If
19 the user desires to deposit an object from within an OLE
20 environment (i.e., selects a "save" function within an OLE
21 aware applications program), the ObjectBank System reads
22 each object and attempts to identify the type of object --
23 WordPerfect, Dbase, Lotus, CAD, etc. If the user has not
24 accessed the ObjectTeller functions through an OLE aware
25 applications program, the user must identify/select the
26 object(s) that will be deposited. The user can also
27 select whether the object to be deposited is temporary or
28 permanent. If no object is identified for deposit through
29 an OLE aware application, an object identification card
30 (template) is presented to the user for completion. The
31 user then inputs 203 certain minimum object identification
32 information such as the object name, object type and
33 object location. Wildcard characters (e.g., ?, /, *) may
34 be used. If the user does not input the object type, the
35 ObjectTeller deposit routine will evaluate and
36 automatically select the object type. If the user does
37 not input the object location, a list of default paths is
38 presented allowing the user to select between directories
39 and drives.

1 3. Fill-out object Index Card 204. Once the object
2 identification card is completed 203, the deposit function
3 locates the identified object and evaluates its type and
4 verifies it against the user's indication or (if no user
5 indication of type), the deposit function automatically
6 identifies and classifies the type of the identified
7 object. The ObjectTeller program creates a user index
8 card from a default index card template for each type of
9 object, partially completes the index card with minimum
10 data from the object for identification and storage, then
11 displays the index card to the user for completion 204.
12 If the object has previously been deposited in the
13 ObjectBank System, then a list of all the previous
14 relative index cards is presented which identify any
15 related object(s) (i.e., "parents," "children" or
16 "siblings"). The user can retrieve and look at the index
17 cards for these parent/children/siblings objects and do an
18 on-screen object comparison before deciding whether to
19 continue with the depositing of the object. The user can
20 then select and examine the various index cards and either
21 select one for the default model or request a new index
22 card template having the minimum identification and
23 storage data for the object to be deposited. The user
24 then completes 204 the index card by inputting optional
25 information such as co-users interested in this object,
26 the object generation, an object alias, the visibility
27 indicator, the primary object level, object creation or
28 reference date, cross-reference keys within the object and
29 cross-reference keys to other objects. In addition, the
30 user indicates by inputting a check on the index card
31 his/her choice for object encryption, compression,
32 password access protection and/or object deletion from the
33 local ObjectSafe's subdirectory after deposit to the
34 target ObjectSafe\Vault. An index card is completed for
35 each object to be deposited.

36 4. Initiate Deposit Function 205. If the user
37 desires to continue with the deposit of the object, the
38 ObjectSafe deposit function is initiated 205. The object
39 index card data is placed in a structure and read to

1 determine if the object to be deposited is to be encrypted
2 206 and compressed 208 before depositing. The default is
3 to encrypt 207 and compress 209 the object before the
4 object is deposited to a target ObjectSafe\Vault. If the
5 object is to be encrypted 207, the object is located, its
6 size and storage requirements evaluated, then encrypted
7 and the storage setup. If the object is to be compressed
8 209, the object is located, its size and storage
9 requirements evaluated, then compressed and storage setup.

10 5. Deposit object to local or non-local ObjectSafe
11 210. The ObjectTeller program then determines 210 if the
12 object is to be deposited to the local (computer resident)
13 ObjectSafe or to a non-local ObjectSafe located elsewhere
14 on the ObjectWire Network 1. If the object is to be
15 deposited in a non-local ObjectSafe, then the object and
16 related index card is located, object accounting
17 (tracking) information added, and the object placed 211 in
18 the Outbox for pick-up by the target ObjectSafe computer.
19 A deposit request index card is placed 212 in the Message
20 Exchange Database, and after which, the ObjectTeller
21 deposit routine is terminated 218.

22 6. Perform ObjectBank system error checking 213.
23 If the object is to be deposited in a local
24 ObjectSafe\Vault, then the object is located and industry
25 standard system error checking functions are performed 213
26 including checksum validation on the source and altered
27 object form, size and storage requirement evaluation and
28 comparison to local target storage capacity, and the
29 system clock switch is set and results conditions checked.
30 The ObjectTeller program reads ("copies") each object into
31 its "work area" RAM from the source object, then
32 calculates checksums for data validation. It compares the
33 object in the work area to the source object checksums to
34 verify data transmission accuracy. It also checks to make
35 sure there is sufficient space on the target ObjectSafe
36 for the object to be deposited, so as not to exceed the
37 pre-configured maximum ObjectSafe storage capacity. If an
38 error is detected 217, then an ObjectDeposit error message
39 template is created and placed 217 in the local Message

1 Exchange Database and the ObjectTeller Deposit routine is
2 terminated 218.

3 7. Deposit the object to the target ObjectSafe 215
4 or indicate system error 217. If the system error checks
5 are successful and no error is detected 214, then the
6 object is located, object accounting information added,
7 and then deposited 215 from the work area RAM into the
8 target ObjectSafe. The object index card is located in
9 the work area RAM, object accounting information added to
10 indicate a successful deposit location, then placed 216 in
11 the local target ObjectSafe and in the Message Exchange
12 Database with a public routing code ("flags") so all other
13 ObjectSafe computers on the ObjectWire Network 1 can
14 update their indexes. The ObjectTeller deposit routine is
15 then terminated 218.

16 If the object is to be deposited in an ObjectSafe on
17 another ObjectBank System computer on the ObjectWire
18 Network 1, the source ObjectBank System ObjectWire program
19 will keep polling the Message Exchange Database on the
20 target ObjectSafe computer until a message appears that an
21 updated index card for the deposited object appears
22 indicating that the deposit was successful, its deposit
23 location, and that an updated index card is available for
24 pick up in the target ObjectSafe computer's Out Box. The
25 updated index card is then copied from the target
26 ObjectSafe's Out Box to the source ObjectSafe. When
27 successfully copied, the object will be cleared from the
28 source Out Box and an Index Updated message, cross-
29 referenced to the object, will be placed in the source
30 ObjectBank computer's Message Exchange Database and routed
31 to the target ObjectSafe. When a duplicate index updated
32 message appears in the Message Exchange Database of the
33 source ObjectSafe computer with the source user's routing
34 code, the target ObjectBank System will clear its Out Box
35 of all information related to the object. If the user has
36 indicated that the object should be moved/deposited to a
37 Null Device, it will be deposited to the Null Device and
38 essentially deleted from the source ObjectSafe.

1 Fig. 4 is a flowchart diagram of the ObjectTeller
2 program withdrawal routine 300 is shown having functions
3 to withdraw an object from a target ObjectSafe\Vault. A
4 user withdraws objects by selecting and executing from a
5 menu the ObjectTeller withdrawal routine 301. This causes
6 the ObjectTeller.ini file to be read and saved in a
7 temporary object. The local Message Exchange Database and
8 local ObjectSafe are opened and arrays for the available
9 ObjectSafes and ObjectVaults, user data, and index card
10 templates are built.

11 1. Complete Search Index Card for object index card
12 search 302. The first step in the withdrawal of an object
13 from the ObjectBank System is to first identify the object
14 and its location by conducting an object index card
15 search. When executing the ObjectTeller withdrawal
16 process routine 301, the ObjectTeller program invokes the
17 Sindex.dlg file which displays a search index card having
18 blank fields to be completed 302 by the user. The user
19 then completes the fields which designates which
20 ObjectSafes are to be searched and what object and/or type
21 of object index card is to be withdrawn from the designated
22 target ObjectSafes. The more search criteria input on the
23 Search Index Card, the more inclusive and narrower the
24 search for a particular object or type of object Index
25 Card. If the user cannot type entries in the search
26 fields, then clicking upon the fields causes a list to be
27 presented showing available selections for the selected
28 search criteria.

29 Once the search criteria is input/selected 302, the
30 ObjectTeller withdrawal routine parses the completed
31 search fields and sets up a search criteria database. A
32 fuzzy search of the index cards of the designated local
33 ObjectSafe is then performed 303 matching the Search Index
34 Card to the desired object(s) index card. The matching
35 index cards are collected in an array and displayed 304 in
36 a list format for review by the user. The ObjectBank
37 System reports how many index cards have been found with
38 an exact match and how many with a "fuzzy" match. If a
39 matching index card has not been found in the local

1 Objectsafe(s) (e.g., as a result of the object being
2 deposited to an ObjectVault and removed from the local
3 ObjectSafe in order to save disk space) and a search of
4 additional Index Cards is desired 305, then the user can
5 request a withdrawal of object index card(s) from an
6 ObjectVault and/or other ObjectSafes on the ObjectWire
7 Network 1 and an index card withdrawal request will be
8 placed in the Message Exchange Database 306. The user is
9 allowed to select for searching other ObjectSafes on the
10 ObjectWire Network to which he has been authorized access.
11 The user can select multiple target ObjectSafes if the
12 desired object(s) may have been deposited in several
13 ObjectSafes on the ObjectWire Network. Any additional
14 found index cards returned by the request will be
15 displayed 304 in the list format for review by the user.
16 If the user determines he has not found the desired
17 object(s), he can change 307 the search criteria and fill-
18 out another Search Index Card and another object index
19 card search process can be performed 303 and the results
20 of the search displayed 304.

21 2. Select the index card of the object to be
22 withdrawn 308. To view an index card of the object to be
23 withdrawn, the user selects 308 the desired index card
24 from the displayed list. By selecting 308 the index card
25 to be viewed, the ObjectTeller withdrawal routine parses
26 the ObjectBank account, type and location data so the user
27 can see the detail of the index card, including
28 information on the genealogy and pathway of who has
29 deposited and who has withdrawn the object. The user can
30 also look at the index cards for the
31 parents/children/siblings before deciding whether to
32 continue.

33 3. Initiate the withdrawal function 309. To
34 withdraw one or more objects identified on the index
35 cards, the user initiates the ObjectSafe withdrawal
36 function by selecting 309 the desired object to be
37 withdrawn. This causes the index card data to be placed
38 in the search structure. It should be noted that if the
39 user is not accessing the ObjectTeller program through an

-31-

1 OLE environment, the user must indicate to which drive,
2 directory, and filename the object will be copied
3 (withdrawn to). If nothing is entered, then a directory
4 display will appear allowing the user to highlight certain
5 drives and directories. If the user is retrieving
6 temporary information, he has the option of indicating
7 that the information should be deleted from the source
8 ObjectSafe after successful withdrawal into the work area
9 RAM.

10 4. Perform system error checking 310. Once the
11 ObjectSafe withdrawal function is initiated 309, the
12 object size is determined and formed in an index structure
13 and System error checking is performed 310 evaluating the
14 required size and storage and comparing it to the local
15 target ObjectSafe\Vault capacity so as not to exceed the
16 pre-configured maximum storage capacity. If an error is
17 detected 311, an ObjectWithdrawal error message is created
18 and placed 312 in the Message Exchange Database and the
19 ObjectTeller withdrawal routine is terminated 319.

20 5. Determine locality of object to be withdrawn
21 313. If no System error is detected 311, the
22 ObjectTeller program determines if the object(s) to be
23 withdrawn are to come from a local ObjectSafe or a non-
24 local ObjectSafe 313.

25 If the withdrawal is to be made from a non-local
26 ObjectSafe (i.e., an other ObjectBank System having an
27 ObjectSafe or ObjectVault) a withdrawal request with the
28 correspondent information and flags to alert the target
29 ObjectSafe (object "source" ObjectSafe) is placed in the
30 Message Exchange Database 314. The ObjectTeller
31 withdrawal routine is then terminated 319 and the
32 ObjectWire program polling routine will begin cyclically
33 polling the target ObjectSafe(s) Message Exchange Database
34 to detect when the desired object is ready to be picked-up
35 from the target ObjectBank computer's Out Box 601 (see
36 Fig. 7).

37 6. Withdraw object from local ObjectSafe 315. If
38 it is determined 313 that the withdrawal is to be made
39 from a local ObjectSafe, the object is located in the

1 local ObjectSafe and read ("copied") 315 into the local
2 work area RAM. If necessary, the withdrawn object is
3 decompressed and decrypted 316.

4 The withdrawn object is then located in the local
5 work area RAM, the target location where the object is to
6 be deposited is verified, and the copy of the object
7 deposited in accordance with the deposit function 205 (see
8 Fig. 3) to the target ObjectSafe\Vault.

9 The index card for the object withdrawn is then
10 updated with the accounting and time information and
11 placed 318 in the Message Exchange Database for pick-up
12 and notification of the source ObjectSafe computer and
13 update of it's object index card that the transaction was
14 completed. Once the index card of the source ObjectSafe
15 is updated and a message placed in the Message Exchange
16 Database, the ObjectTeller withdrawal routine is
17 terminated 319. It should be noted that if the
18 withdrawal is made from a non-local ObjectSafe, then an
19 Updated Index Card message will be placed in the source
20 ObjectBank Message Exchange Database indicating that the
21 source ObjectBank's index card has been updated and the
22 Out Box cleared. When the requesting ObjectBank
23 computer's ObjectWire program detects the Updated Index
24 Card message, it will clear its Message Exchange Database
25 with regard to that withdrawal transaction.

26 Fig. 5 is a flowchart diagram of the ObjectTeller
27 program's Status process routine 400 having functions to
28 allow the user to review the status of object deposits and
29 withdrawals and to terminate in-process deposits and
30 withdrawals, if desired.

31 Referring now to Fig. 5, to determine the status of
32 withdraw or deposit or to terminate a withdrawal or
33 deposit, a user selects 401 from a menu the ObjectTeller
34 Status process routine. This causes the ObjectTeller.ini
35 file to be read and saved in a temporary object. In
36 addition, the local Message Exchange Database is opened.

37 The local Message Exchange Database is checked 402
38 for any changes, i.e., whether or not a new message has
39 been added or an old message has been deleted since the

1 last recorded date-time-stamp. Each time the Message
2 Exchange Database is checked, a date-time-stamp ("DTS") is
3 recorded and the last DTS is read for access checking. A
4 "DTSKEY" is used to access the Message Exchange Database
5 messages. If no change is detected 403 since the last
6 DTS, the Status function continues to check the local
7 Message Exchange Database until a change is detected.
8 Once a change is detected 403, a new DTSKEY will be stored
9 and the type of message change (i.e., index card or
10 deposit or withdrawal request message) is determined 404.

11 If the change is an index card message or a deposit
12 or withdrawal request message, an acknowledgement flag is
13 checked 406 to determine if the request is still in
14 process. If acknowledged, the deposit or withdrawal
15 request is complete and the object deleted 407 from the
16 Message Exchange Database, the index card is stored 408 in
17 the Message Exchange Database, and a handling message is
18 setup and presented 405 to notify the user of the present
19 status. If not acknowledged, the request is still in
20 process and the index card is stored 408 in the Message
21 Exchange Database and a handling status message is setup
22 and the user presented 405 with the present status.

23 If the message determined 404 is not an index card or
24 deposit or withdraw request, an error message is created
25 and the handling status message is setup and presented 405
26 to the user.

27 Once the user has been notified of the present status
28 405, obsolete messages can then be removed from the
29 Message Exchange Database 409 (as necessary) and stored in
30 the local Objectsafe and a user notification list setup.
31 If the user desires to continue checking the status of
32 deposits and withdrawals, the local Message Exchange
33 Database is polled 410 for changes as before. If the user
34 does not desire to continue checking the status of
35 deposits and withdrawals, the Status function is
36 terminated 411.

37 The ObjectWire program 4 (Fig. 1) comprises functions
38 to permit a user to communicate between two or more
39 ObjectBank Systems (e.g., 2, 2a, 2b, 3, and 3a) to process

1 the deposit and withdrawal of objects to and from one or
2 more ObjectSafes (6, 7, 9 and 10) and/or ObjectVaults (8)
3 on the ObjectWire Network 1.

4 Fig. 6 is a flowchart diagram of the ObjectWire
5 program configuration routine 500. The ObjectWire
6 configuration routine permits the user to custom configure
7 at any time which ObjectBank Systems (ObjectSafes) on the
8 ObjectWire Network are to be polled 502, which ObjectBank
9 Systems are not to be polled 507, how the ObjectBank
10 System to be polled is accessed 504, when the selected
11 ObjectBank Systems are to be polled 505, and also to
12 change the criteria of the objects (Index Card, Index Card
13 Message or Object) to be polled 510.

14 The ObjectWire Configuration routine is accessed and
15 executed by way of menu selection via the ObjectTeller
16 program 5 (Fig. 1). Upon the execution of the ObjectWire
17 configuration routine 501, the ObjectTeller.ini file is
18 read and saved in a temporary object, the local Message
19 Exchange Database and local ObjectSafe are opened, and
20 arrays for the available ObjectSafes and ObjectVaults,
21 user data, and index card templates are built. In
22 addition, the "Ow.dlg" (ObjectWire configuration menu)
23 file is invoked.

24 The user has the option of menu selecting the
25 ObjectSafes to be polled 502, to select those ObjectSafes
26 which are not to be polled 507 and to change the item
27 (i.e., index card, message and/or object) criteria to be
28 polled 510.

29 If the user selects the ObjectSafe(s) to be polled
30 list (Change Do Poll List) 502, the SAFE.dlg file is
31 invoked and the ObjectSafes and ObjectVaults known to this
32 ObjectTeller are listed and the current target ObjectSafe
33 and ObjectVault indicated. The user then selects 503 from
34 the list those ObjectSafes to which the user is permitted
35 access.

36 After an ObjectSafe is selected 503 to be polled, the
37 "SAFENAV.dlg" (ObjectSafe navigation information) file is
38 invoked and the user inputs 504 the manner (i.e., pathway
39 and procedure: address/telephone, number/password, etc.)

1 by which the target ObjectSafe is to be accessed. Once
2 the user inputs 504 how the target ObjectSafe can be
3 accessed, the user inputs 505 the time interval upon which
4 the target ObjectSafe is to be polled or accepts the
5 default (ObjectTeller.ini) interval. When the user has
6 completed selecting 503 the target Objectsafe(s) to be
7 polled and inputting how 504 and when 505 the target
8 ObjectSafe(s) are to be polled, the ObjectWire
9 configuration database file OBJBANK.INI is updated 506.
10 The user is then returned to the beginning of the same
11 option of whether or not to change the ObjectSafe polling
12 list 502.

13 If the user no longer desires to change 502 the
14 ObjectSafe polling list, then the user has the option of
15 selecting 507 from a menu those ObjectSafes that are not
16 to be polled 507. If the user selects 507 to change the
17 ObjectSafes not to be polled, then the SAFE.dlg file is
18 invoked, the ObjectSafes and ObjectVaults known to this
19 ObjectTeller are listed and the current ObjectSafe and
20 ObjectVaults are indicated. The user then selects 508
21 from the list the desired ObjectSafes/Vaults that are not
22 to be polled. The SAFENAV.dlg (ObjectSafe navigation
23 information) file is invoked and the user marks 509 those
24 ObjectSafes/Vaults as "NOTPOLL." After the ObjectSafes
25 are marked 509, the ObjectWire configuration database file
26 OBJBANK.INI is updated 506. The user is then returned to
27 the beginning of the option of whether to change the
28 ObjectSafe polling list 502; if not, then to the change
29 the do not poll list; and, if not, then the user has the
30 option of changing 510 the items to be polled.

31 If the user chooses the menu option to change 510 the
32 items to be polled, the user is presented with a list of
33 polling items, i.e., the user can select 511 the index
34 card or message criteria to change. The selection tabs
35 on/off an index card/message awareness switch. Once the
36 desired item criteria has been changed 511, the user is
37 presented with a polling object list from which he/she can
38 select to change 512 the object or type of object criteria
39 to be polled. In addition, the user can also enter a new

1 object type to be included in the polling criteria. Once
2 the user selects 512 the object criteria to be changed
3 and/or enters the new object type to be included in the
4 polling criteria, the ObjectWire configuration database
5 file is updated 506. The user is then returned to the
6 beginning of the option of whether to change the
7 ObjectSafe polling list 502; if not, then to the change
8 the do not poll list; if not, then the user has the option
9 of changing 510 the items to be polled; if not, then the
10 ObjectWire configuration routine is terminated 513. The
11 user returns to the ObjectTeller program 5 (Fig. 1) menu
12 operating environment.

13 Fig. 7 is a flowchart diagram of the ObjectWire
14 program polling routine 600. The ObjectWire program
15 polling routine operates continuously in the background in
16 a Microsoft Windows® type OLE operating environment and is
17 also manually executable by menu selection via the
18 ObjectTeller program 5 (Fig. 1). Upon execution 602, the
19 ObjectTeller.ini file is read and saved in a temporary
20 object, calls are made for available servers on each
21 adapter installed in the ObjectBank System and then
22 listens for broadcast signatures of network servers. If
23 a server is found 603, the OBJBANK.INI database file is
24 updated 604 with the server information (pathway,
25 telephone number, password, etc.) and the server is added
26 to the presently available polling list.

27 Then, as configured by the ObjectWire Configuration
28 routine 501, the ObjectWire Polling routine cyclically
29 polls 605 target ObjectBank Systems (servers) at a given
30 time. Each time an ObjectBank System is polled, a date-
31 time-stamp ("DTS") is recorded. If it is not time to poll
32 605 a given target ObjectBank System, a user has the
33 option of having the ObjectWire polling routine continue
34 polling 606 and listen 602 for Network servers or the
35 polling routine can be terminated 607 and the user
36 returned to the menu operating environment of the
37 ObjectTeller program 5 (Fig. 1). If it is time to poll
38 605 a given target ObjectSafe System, the ObjectWire
39 polling routine will check 608 to see if the Objectbank

1 System is "logged-on" to the target Objectbank System. If
2 the ObjectWire Polling routine detects 608 that the
3 Objectbank System was logged-on, then the logical device
4 is redirected 610 to the target ObjectBank System's
5 ObjectSafe (server) location, the last DTS for this server
6 is read and the Message Exchange Database is opened for
7 this server. If the Objectbank System was not logged on
8 608, the ObjectWire Polling program will log-on 609 to the
9 target ObjectBank System, set 609 a flag called
10 "WasLogged" to equal "false," set a flag called "LogOn" to
11 equal "yes," and then redirect 610 the logical device to
12 the target ObjectSafe. Once the logical device has been
13 redirected 610, the ObjectWire polling routine determines
14 611 if there are any messages put in the Message Exchange
15 Database since the last DTS. If there are no messages
16 since the last DTS and the "WasLogged" flag is set to
17 "false," then the ObjectWire Polling routine logs-off 612
18 the server and sets the LoggedOn flag equal to "no." The
19 ObjectWire Polling routine returns to the polling process
20 at step 605 (Time to Poll any Servers). If there is one
21 or more messages since the last DTS 611, then the
22 ObjectWire Polling routine determines 613 if any message
23 matches the search criteria as set during the ObjectWire
24 Configuration process 501-513 and what type 614 each
25 message is, i.e., a withdrawal request, deposit request or
26 index card message. If the message is a withdrawal
27 request, the ObjectTeller withdrawal routine function
28 (309) is performed 615 to the Outbox and the ObjectWire
29 polling routine continues 606. If the message is a
30 deposit request, the object is read and the ObjectTeller
31 deposit function (205) is performed 616 and the ObjectWire
32 polling routine continues 606. If the message is an index
33 card message, then it is determined 617 whether or not the
34 message is one that originated from this ObjectBank System
35 617. If yes, i.e., it is a message originating from the
36 local ObjectBank, then it is an acknowledgment of a
37 deposit or withdrawal request and it is read and stored
38 618 in the local Message Exchange Database for further
39 processing, and the ObjectWire Polling routine continues

1 606. If the message did not originate from this
2 ObjectBank System, then the message is read and stored 619
3 in the local Message Exchange Database for further
4 processing. If an object is associated with the message
5 and the object is in the ObjectBank System's read area,
6 the object is read and stored in the temporary storage
7 area of the ObjectSafe, and the ObjectWire Polling routine
8 continues 606 until terminated 607.

9 Fig. 8 is a flowchart diagram of the ObjectWire
10 program Withdrawal routine 700. The ObjectWire program
11 withdrawal routine operates 701 continuously in the
12 background in an OLE operating environment and is also
13 manually executable by menu selection via the ObjectTeller
14 program 5 (Fig. 1). The ObjectWire withdrawal routine
15 looks 702 for any withdrawal or index card requests in the
16 local Message Exchange Database. If none are found, the
17 user has the option 703 of continuing to look 702 for
18 local withdrawal or index card requests or terminate 704
19 the ObjectWire withdrawal routine which returns the user
20 to the operating menu environment of the ObjectTeller
21 program 5 (Fig. 1). If a withdrawal or index card request
22 is found 702 in the local Message Exchange Database, then
23 the ObjectWire withdrawal routine will check 705 to see if
24 the Objectbank System is logged-on to the source
25 Objectbank System. If the ObjectWire Withdrawal routine
26 detects 705 that the Objectbank System was logged-on, then
27 the logical device is redirected 707 to the source
28 ObjectBank System's ObjectSafe. If the Objectbank System
29 was not logged-on 705, the ObjectWire Withdrawal routine
30 will log-on to the source ObjectBank System server, set
31 706 the "WasLogged" flag to equal false, set the "LogOn"
32 flag to equal "yes," redirect 707 the logical device to
33 the source ObjectSafe (server) location, and then open the
34 ObjectSafe on this server. Once the logical device has
35 been redirected and the ObjectSafe opened 707, the
36 ObjectWire withdrawal routine locates the object size and
37 form in the index structure, evaluates its size and
38 storage required and compares it to the local target
39 capacity. If ok, the object is located in the

-39-

1 corresponding source ObjectSafe OutBox and read
2 ("withdrawn" or "copied") into the local work area RAM
3 708. The object is then located in the local work area
4 RAM and decompressed and decrypted 709, if necessary.
5 Then object is again located in the local work area RAM,
6 the target ObjectSafe location verified, and the object
7 copied 710 to the target location. After the object has
8 been copied 710 to the target location, the withdrawal is
9 acknowledged 711 by placing an Updated Index Card in the
10 Message Exchange Database with the accounting and time
11 information. After the withdrawal has been acknowledged
12 711, if the "WasLogged" flag is equal to "false," then the
13 ObjectWire withdrawal routine causes the System to logoff
14 712 the server, set "LogOn" to equal "no," and return to
15 the option 703 of whether or not to keep looking for local
16 withdrawal or index card requests 702 or to terminate 704
17 the ObjectWire Withdrawal routine.

CLAIMS

1 1. A highly secure, virus resistant, tamper
2 resistant, object oriented, data processing system for
3 depositing, withdrawing and communicating electronic data
4 between one or more individual and/or networked computers
5 comprising:

6 a) at least one computer means for processing
7 electronic data;

8 b) at least one of said computer means including at
9 least one or more shared electronic storage means for
10 temporary or permanent storage of said electronic data;
11 and

12 c) each of said computer means including program
13 means for asynchronous deposition, withdrawal and
14 communication of said electronic data to said shared
15 electronic storage means.

1 2. An object oriented data processing system as in
2 claim 1, wherein said program means includes:

3 a) means for user definable installation and
4 configuration of said storage means and said program means
5 to said system;

6 b) means for archival, accountability,
7 security, encryption and decryption, compression and
8 decompression, and multi-processing of said electronic
9 data; and

10 c) said electronic data is only deposited,
11 withdrawn and communicated through copying of said data on
12 said system.

1 3. In a computer system comprising of one or more
2 individual or networked computers, each of said computers
3 including an object oriented user interface program, an
4 object oriented communications program, and at least one
5 of said computers having an electronic data storage means
6 having a plurality of specifiable regions, a method for
7 peer to peer depositing, withdrawing and communication of

8 electronic data between said one or more individual or
9 networked computers comprising the steps of:
10 a) asynchronously depositing electronic data
11 to said data storage means;
12 b) asynchronously withdrawing electronic data
13 from said data storage means; and
14 c) asynchronously communicating between said
15 computers said data to be deposited and withdrawn from
16 said data storage means using said deposit and withdrawal
17 routines.

1 4. A method as in claim 3 wherein said step of
2 depositing electronic data includes the steps of:
3 a) selecting one or more of said data storage
4 means to which said data is to be deposited;
5 b) identifying the data to be deposited to
6 said selected data storage means as either temporary data
7 or permanent data;
8 c) creating a corresponding electronic data
9 index and inputting to said data index reference
10 information of said data to be deposited;
11 d) determining the location of said selected
12 data storage means to which said data is to be deposited;
13 e) storing said data to said storage means at
14 said determined location;
15 f) updating said data index with further
16 reference information about said deposited data; and
17 g) storing said updated data index in a first
18 specified region of said data storage means for
19 communication between said computers.

1 5. A method as in claim 4, wherein said step of
2 depositing electronic data further includes the steps of:
3 a) storing said data to be deposited to a
4 second specified region for communication between said
5 computers using said communications routine;
6 b) detecting a second updated data index
7 indicating the data to be deposited has been successfully
8 deposited to said selected data storage means;

- 9 c) encrypting said data to be deposited; and
10 d) compressing said data to be deposited.

1 6. A method as in claim 5 wherein said step of
2 depositing electronic data further includes the steps of:

3 a) performing system error checks prior in
4 time to the depositing of said data to said data storage
5 means; and

6 b) generating and storing any error message
7 resulting from said system error checks in said first
8 specified region of said storage means for communication
9 to said plurality of computers.

1 7. A method as in claim 3, wherein said step of
2 withdrawing said electronic data includes the steps of:

3 a) completing a second corresponding
4 electronic data index card with reference information to
5 be used in the conduct of a comparison search of said
6 storage means for said first electronic data index cards
7 having matching reference information to said electronic
8 data to be withdrawn;

9 b) conducting said comparison search to
10 determine any said matching reference information to said
11 completed second data index card;

12 c) displaying said first data index cards
13 having said matching reference information to said
14 completed second data index card;

15 d) selecting any of said first data index
16 cards displayed identifying the data to be withdrawn;

17 e) determining the storage location of said
18 selected data index cards to be withdrawn and the location
19 from which said identified data is to be withdrawn; and

20 f) withdrawing from said determined location
21 said identified data to random access memory of said
22 computer system.

1 8. A method as in claim 7 wherein said step of
2 withdrawing said electronic data includes the steps of:

- 3 a) placing a withdrawal request message in
4 said second specified region for communication to any of
5 said plurality of computers using said communications
6 routine;
7 b) performing said system error checks
8 subsequent in time to said withdrawal of said electronic
9 data to said random access memory;
10 c) generating and storing any error message
11 resulting from said system error checks in said first
12 specified region of said data storage means for the
13 communication of any said error message to said system and
14 any of said plurality of computers;
15 d) updating said first index card with
16 information about said data withdrawn from said data
17 storage means;
18 e) storing said updated first data index card
19 in said second specified region of said data storage means
20 for communication to said plurality of computers by use of
21 said communications routine;
22 f) decompressing said withdrawn electronic
23 data; and
24 g) decrypting said withdrawn electronic data.

1 9. A method as is claim 3 which comprises a status
2 routine including the steps of:

- 3 a) recording a date-time-stamp to said first
4 region;
5 b) checking said first specified region for
6 data recorded to said first region subsequent in time to
7 said date-time-stamp;
8 c) determining the type of any of said
9 changes;
10 d) determining if any of said determined types
11 are still in process;
12 e) deleting said types that are still in
13 process;
14 f) storing said data index card of types still
15 in process in said first specified region; and

16 g) updating said data index card with the
17 present status and displaying said status.

1 10. A method as in claim 9, wherein said step of
2 communicating between said computers includes the steps
3 of:

4 a) determining and displaying a list of said
5 computers available for communication with said system;

6 b) selecting from said list the computers to
7 be communicated with said system;

8 c) inputting a cyclical time interval with
9 which communication between said selected computers shall
10 occur;

11 d) recording to a configuration file for
12 subsequent use by said system said selected computers and
13 input time interval

14 e) determining and displaying criteria to be
15 communicated between said selected computers; and

16 f) inputting changes to said criteria.

1 11. A method as in claim 3 wherein said step of
2 communicating between said computers further includes the
3 steps of:

4 a) listening for the initiation of
5 communications from any of said computers and adding the
6 logical path of said computers initiating said
7 communications;

8 b) cyclically initiating communications
9 between said computers;

10 c) directing a logical device to said
11 computers with which said communications have been
12 initiated;

13 d) determining the existence of messages
14 subsequent in time to the last recorded of said
15 communications between said computers;

16 e) determining which of said messages includes
17 matching data;

18 f) determining the type of said messages
19 having said matching data; and

20 g) performing one of said steps of depositing
21 said electronic data to said data storage means,
22 withdrawing said electronic data from said data storage
23 means, or reading and recording said messages to said
24 storage means, according to the determined type of said
25 messages.

1 12. A method as in claim 3 wherein said step of
2 communicating between said computers includes the steps
3 of:

4 a) cyclically determining the existence in
5 said storage means of any request messages from any of
6 said computers;

7 b) initiating communications with said
8 computers from which any of said request messages
9 originated;

10 c) directing a logical device to said
11 computers;

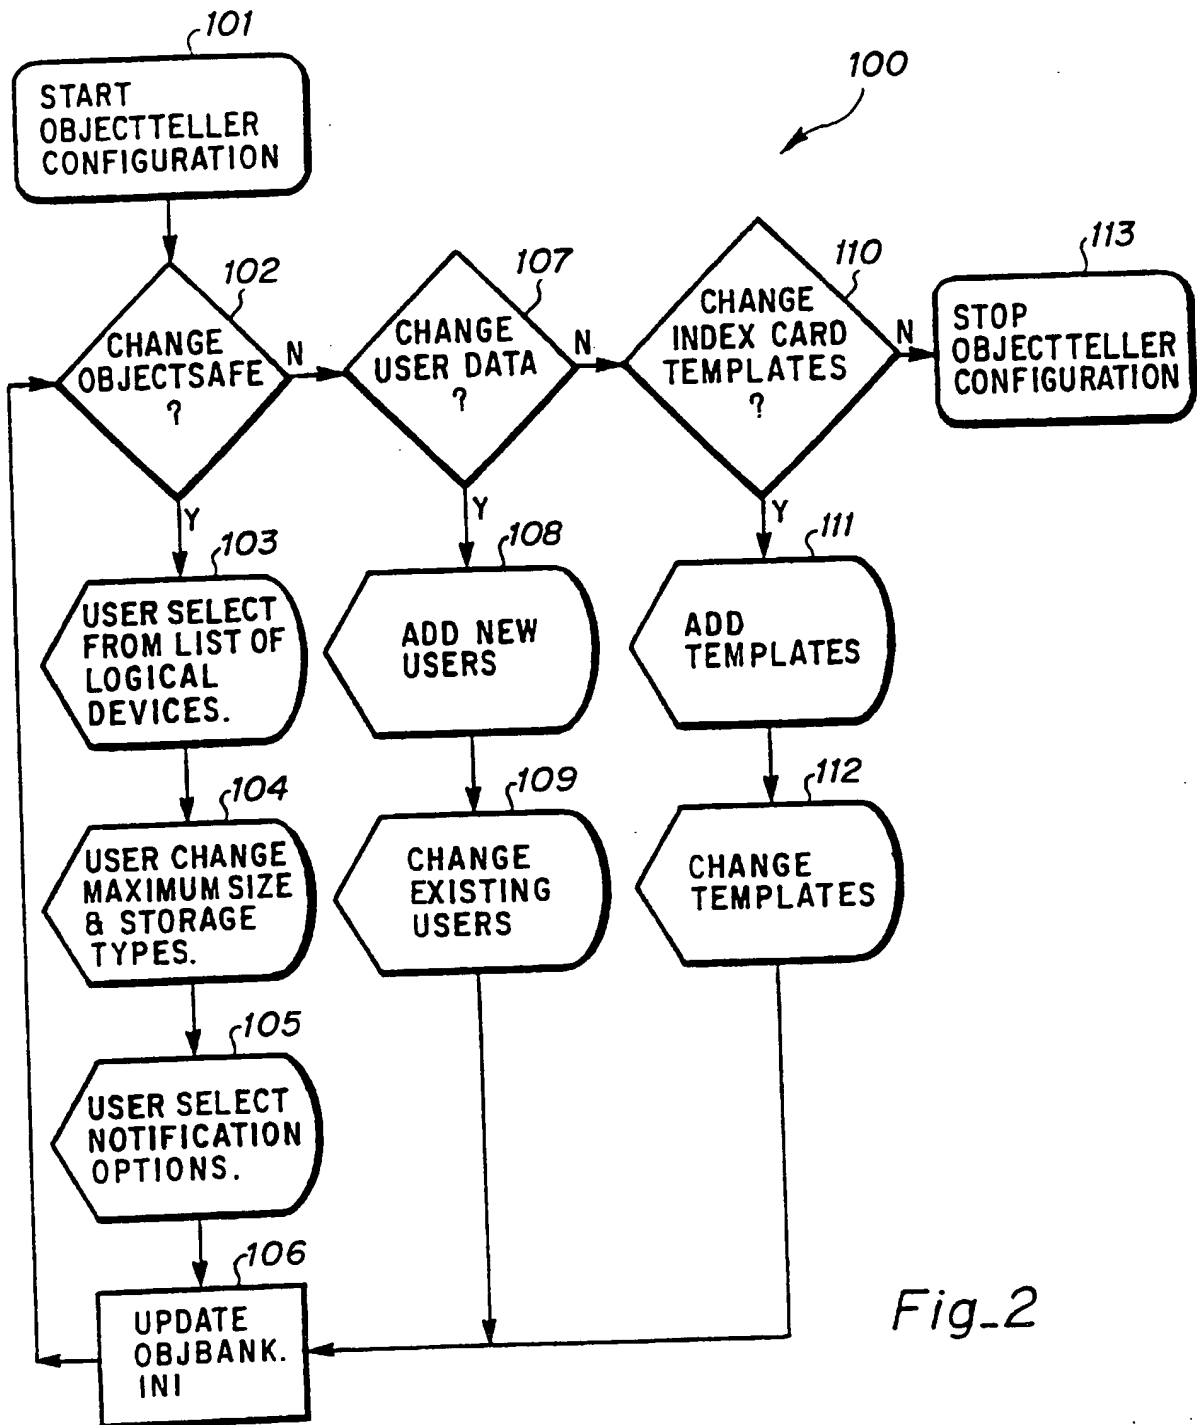

12 d) reading data from said computers;

13 e) copying said data to said storage means;

14 and

15 f) decompressing and decrypting said read
16 data.

INTERNATIONAL SEARCH REPORT

International application No.
PCT/US93/11865

A. CLASSIFICATION OF SUBJECT MATTER

IPC(S) : G06F 15/40

US CL : 395/200; 395/425

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

U.S. : 395/200, 275, 425, 600

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)

Please See Extra Sheet.

C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category*	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
X	US,A,5,093,911 (Parks et al.) 03 March 1992, Abstract, col. 1 lines 55-68.	1-4
A	US,A,4,833,625 (Fisher et al.) 23 May 1989, Abstract.	1-12
Y	US,A,5,150,473 (Zulch) 22, September 1992, Abstract.	2

A,E	US,A,5,278,955 (Forte et al.) 11 January 1994, Abstract	1-12
Y,P	US,A,5,247,638 (O'Brien et al.) 21 September 1993, Abstract.	1-12

☒ Further documents are listed in the continuation of Box C. ☐ See patent family annex.

* Special categories of cited documents:	*T* later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
A document defining the general state of the art which is not considered to be part of particular relevance	*X* document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
E earlier document published on or after the international filing date	*Y* document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art
I document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)	*Z* document member of the same patent family
O document referring to an oral disclosure, use, exhibition or other means	
P document published prior to the international filing date but later than the priority date claimed	

Date of the actual completion of the international search.
